

Animal behaviour before earthquakes

My Monbusho-Prof. Ikeya wired up some Namazo (catfish) and measured the moves before earthquakes and artificial signals coming from compressed rock to understand the phenomena.

Chinas approach was more pragmatic. They trained many observers in zoos, farms....in 1974. In December many animals (including trained dogs and riding-horses) acted totally untypical. Ground water changed as well. A little quake was predicted and happened on Dec.22. Observation was intensified and evacuation planned. In January 20 kinds of animal showed strange behaviour, wells became artesian and changed taste and look. After a series of little quakes Haicheng (500 000people) was evacuated 4. February morning and destroyed at 19 36h. This worked also in other cities. After the Tangshan quake where the suggested warning was not given 500 000 people died and the program ended.

I came into that field because of Radiesthesia research (detecting underground water, healthy areas,...). Since there is a phenomenological part I studied Parapsychology at CIHS (founded by Dr Motoyama), measuring energy (Ki-flow) of the Acupuncture lines of people on dowsed good and bad places and found interesting differences.

More information from me about these topics are in the Journal des Öst. Verb. für Radiästhesie und Geobiologie (in German): Erdbeben Journal Nr89, Radiästhesie, Akupunkturmessungen (with AMI), Parapsychologie Nr.87, AMI perspectives Nr 94; for short questions: gotzmax@yahoo.com
